The Implications of Bodywork

Human Touch Has Powerful Results

Cathy Ulrich

Whether in giving or receiving, touch is as essential to human survival as is food. Infants deprived of touch, even when they are getting adequate nutrition, will fail to thrive. Elders isolated by loss of partners and friends become depressed not only because of the absence of social interaction, but also because of the simple loss of physical contact.

We calm our pets by stroking them, we greet each other with a hug or a handshake, and we soothe our children by holding them. No other form of connection is as powerful and universal as touch. Taking a look at how this sensation is connected to the brain provides insight into the significance of bodywork.

because of our skin. Our skin tells us about our environment and ourselves. When we touch something with our fingers, we're not only sensing the object, we're also feeling our own skin, our own boundaries.

In the first few days of an embryo's life, the cells that eventually become a fully formed baby divide into three layers. The brain and skin come from the same layer, and they develop together, not only before birth, but well into the first year of life. When a baby is held, cuddled, and breast-fed, she's getting crucial stimulation to build neural connections between her skin and her brain that will ultimately last her entire lifetime.

A smile is a light in the window of the soul, indicating that the heart is at home.

No matter the age, human touch plays a significant role in mental and physical health.

Skin and the Brain

The adult human lives inside an envelope of about 18 square feet of skin. Every inch houses thousands of nerve endings and various kinds of sensory receptors, all working to tell the brain about its surroundings. The cold of an ice cube, the softness of a cat's fur, a warm breeze, the caress of a loved one--all of these feelings are possible

Study after study has shown that touch is not only important for development, but is crucial to survival. James H.M. Knox of Johns Hopkins Hospital reported in 1915 that babies left in orphanages and given proper nutrition died at a rate of about 90 percent. Other studies of the same era confirmed

these findings and showed that those babies who did survive were often mentally handicapped and stunted in their growth. These valuable studies helped institutions understand the importance of touch. When staff was added to provide enough time for each child to be held, handled, and touched, mortality rates dropped dramatically.

Massage for Children

Those early statistical studies showed how vital touch is to developing infants. Researchers are also finding that giving massage to premature infants can improve their growth and overall health. A study conducted by the Touch Research Institute (TRI) at the University of Miami found that when stable premature babies were given five, one-minute massages a day, they gained 47 percent more weight than their counterparts who didn't get massage.

A 2001 study conducted by TRI showed that when mothers gave their infants a 15-minute massage before bedtime, these sleep-challenged kids went to sleep more quickly and were more alert during daytime hours.

Conversely, clinical research and sociological studies link touch deprivation with aggression. A 2002 study reported that adolescents with a history of aggressive behavior showed less aggression and were less anxious after receiving a 20-minute massage twice a week for five weeks.

Massage also reduces the symptoms of Attention Deficit Hyperactivity Disorder so kids can concentrate better, and it's even been found that the right kind of touch can help kids with autism relate better to teachers and family members.

Massage for Adults

Ongoing research by the Touch Research Institute continues to prove that massage is an important therapy for many conditions. After a massage, levels of the stress hormone cortisol drop in saliva tests, examinations show an improvement in alertness and relaxation, depression scores decrease, and mental focus improves.

The exponential growth of the bodywork field is a testament to the value of safe, therapeutic touch. Of course bodywork

can play an essential role in the healing of specific chronic or acute orthopedic conditions, but it also serves as a powerful aide in improving the quality of life for adults.

Stan, a former client, was going through a nasty divorce. He had friends to support him emotionally, but it seemed that the thing he missed most was the nurturing touch of his partner. He credits weekly massage appointments, along with seeing a counselor, to his emotional recovery. Massage can be a healthy way to get that much-needed human contact.

Massage for Elders

People confined to nursing homes rarely get more than daily hygienic care in terms of touch. Yet elders need touch as much as infants; studies show that when they receive regular massage, the elderly have less depression and anxiety,

experience better physical coordination, and show a decrease of stress hormone in their saliva.

Geriatric massage is a growing field requiring specialized training, and many massage therapists offer it in their practices. Some nursing homes now provide massage to their residents. Elders appear to respond as well to bodywork as, if not better than, their younger counterparts.

Contact for All Ages

Before babies learn about their hands and feet, they need the touch of loved ones and caregivers. We retain that need our entire lives. Remember to savor touch the next time you're lying on a massage table. Your therapist is not only working out tight muscles, she's contacting your entire nervous system, calming you through pathways that were put in place before you were born.

Infant massage has shown great benefits in calming babies and helping pre-term infants thrive.

A Walking Workout

Have Fun While Burning More Calories

Imagine the lone hiker, backpack laden with sleeping bag and bedroll, wielding a well-worn walking stick as she climbs the side of a snow-covered mountain. For centuries, trekkers have used walking sticks, partly as a defense against attacking wildlife, partly to aid in balance, and partly as support on long, arduous climbs. But in recent years, many hikers have replaced the single wooden walking stick with hiking poles.

Held in both hands and used to distribute weight more evenly through the four limbs, wilderness hikers have found poles invaluable for safety, efficiency, and comfort on long hikes. What wilderness hikers have known for some time now is that walking poles are a great way to relieve pressure on knees, ankles, and the back. They encourage better posture and provide a total body workout by engaging the upper body.

Now, hiking poles are showing up in urban areas as fitness walkers discover the benefits they provide. Nordic walking--similar in technique to cross-

country skiing--is a great way to get a whole body workout, increase oxygen consumption, and burn more calories than regular walking or even speed walking. This total body workout burns 40 percent more calories and consumes 25 percent more oxygen. Poles can be purchased at most outdoor sporting stores, along with rubber tips for use on paved paths.

TECHNIQUE

Adjust your poles to approximately 70 percent of your height and loosely secure the straps around your wrists. Hold the poles at an angle behind you so they propel you forward with a slight bend at the elbow. Use an opposite hand-and-heel motion as you walk--right heel strikes as left pole tip contacts the ground. And you're on your way! Don't be shy with your poles. Remember: You're burning 40 percent more calories.

For more information, visit www.walking.about.com/od/nordicwalking/index.htm.

Add walking poles, and burn more calories.

Boost Your Immune System

Lymphatic Drainage Therapy Fights Infection

Does your immune system work overtime? If so, you might want to give it a boost by seeing a massage therapist or bodyworker trained in lymphatic drainage therapy. This technique can boost your immunity by increasing the production of antibodies, stimulating circulation, moving congestion out of the body, and reducing swelling, especially after surgery.

The lymphatic system supports our body's immune function and involves several organs, glands, and tissues, hundreds of lymph nodes, and a network of vessels. A clear lymph fluid flows through these vessels and carries the metabolic waste (bacteria, dead cells, fats, fluids, proteins, and viruses) to the lymph nodes, where it is filtered. These

nodes often swell when we are sick.

The lymphatic drainage techniques used by massage therapists and bodyworkers gently stimulate lymph nodes, help correct swelling and stagnation in those nodes, reduce local fluid retention, boost the overall immune system, and provide relaxation. As an essential tool in the treatment of lymphedema (excess lymphatic fluid), this therapy is often applied postoperatively and can be especially beneficial for breast cancer patients.

Administering this treatment requires advanced training and is performed with gentle, massage-like strokes. There should be no discomfort involved; in fact, you may feel you are hardly being

worked on at all.

Aftercare

After your lymphatic drainage treatment, it's possible you could feel some mild, flu-like symptoms, depending on how much strain your body has been under prior to treatment. This strain may be due to environmental pollutants, medication, and diet. Most people leave a session simply feeling relaxed, but if you don't feel at the top of your game, drink plenty of water, limit your salt intake, and stay physically active.

Lymphatic drainage is one way to give your wellness a boost in a busy world that makes many demands on your immune system.

*What sunshine is
to flowers,
smiles are to
humanity.*

Hello - Happy Springtime!

Winter's over so it's time to get up, get out, & move around. Many people have begun the annual 'exercise program'. Aches, pains, groans, moans, & a bit of profanity usually accompanies this mission. Go for it! Then see me when you can't move the next day!! And, as I always preach --> s-t-r-e-t-c-h! It can decrease pains & injuries, & doesn't have to take a long time. Or try yoga. Stretching, strengthening, & elongating your lazy sore muscles is a good thing, & yoga does just that. It isn't just for women. Men, try it, you'll be surprised at the results. Nutrition is very important too. We all love junk food, so I won't say don't indulge occasionally. Just be smart about it & limit how much & how often. Sometimes chocolate is crucial to your well-being!

Scheduling your appt. can be easier & a better chance to get the time you want if you schedule before you leave, or a few days before. Plan ahead for your body care.

Referrals are a great way to get new clients. If you refer someone to me, you'll get \$25/off your next session after I treat them. It's an easy way to get a discount!

Smiling causes your brain to release happy endorphins. If you lost your smile, gimme a holler & we'll find it again!

Enjoy the nice weather, & see me when your body hurts!
Smiles always, Lucy
